

Heart Rate Monitoring System using Pulse Sensor with Data Stored on Server

R.Vinodhini, R.Puviarasi

Abstract: *This project is about Heart rate monitoring using pulse sensor in which the data is stored in the server for the later on use. The pulse sensor is connected to the server using Wi-Fi module (Node MCU) to track patients health . The data are sent to server using http protocol. It is like a small device which can be fixed to any atmosphere. It is a less bulky and a portable Wi-Fi module and the person can be connected to their android mobile using Wi-Fi hot spot settings.*

Keywords— *Heartrate, Arduino , Xampp server, pulse sensor, wi-fi module.*

I. INTRODUCTION

The system used here is the heart rate monitoring model, this can be used in almost all the hospitals as well as for general purposes like residential area are too used. In this system, we have used pulse sensor to find the nearby or the actual value of heart beat rate of a normal person. A long ago, scientists or the research scholars has used this process for the accurate measure of the heart beat. In the early period in order to find the heart beat, there is a conductor medium which can be placed in the chest. But nowadays, by using the fingers we can be able to find the heart rate of a person within a fraction of second. The normal heart rate of human is 72 beats per minute. For childrens, the heart rate ranges between 90 beats per minute. The esp8266 wifi module plays a major role in the monitoring system. The pulse rate monitor is also known as the personal monitoring system. The pulse senses the rate of the heart through the blood flowing in the human body. The blood cells blood also helps in finding the human heart rate. When there is a low heart rate functioning happens, we call it as bradycardia. The lower of heart beat can be either a risky thing or sometimes it happens to normal person. To make your heart beat normal regular exercises is much needed to our body. The pulse rate monitored is programmed by Arduino software which is helpful in writing the codes. By writing the separate code for the functioning of pulse sensor working models. While measuring the heart rate, temperature of the body also plays the major role. ECG is also the common method for finding the pulse rate. In this project, the data's can be stored for the later on use. To store the data, local host software is used.

After completing the coding in coding part in Arduino , the Xampp platform detects the type of program which is implemented and saves the data in the local host network. The server used here is xampp and local host part, the table is created based on the contents required for the datas to run in the sequential order. This process can be taken anywhere for the emergency use. Whenever problem arises in one's heart functioning, in order to check the heart rate value this method is considered as the best method. In the XAMPP platform, the datas can be stored with the exact accuracy of date, month, year with the actual time with the seconds is counted. This method is also known as the real time monitoring system. The term denotes that it shows the exact time and a nearby value is noted in the local host. The datas can be calculated by using internet or without a net connection. Firstly, the values can be seen through the output window of the Arduino software. By using the code, the heart rate value is shown in it. As we discussed earlier, ESP8266 wifi module plays a major role in the system. The wifi is connected to the external devices like phone, laptops etc. once it is connected the IP address is noted in the code of Arduino software for the reference value of heart rate data.

II. LITERATURE SURVEY

In ^[1], Ultra-wideband (UWB) radio detection and ranging is used in almost all the major sensing signals works. It is widely used in wireless networking process which consumes only low power with more number of bandwidths can be formed in it. UWB remote sensing can also helps in detecting the problems arising in respiratory functions as well as the cardiac counts occurs. In ^[2], This paper relates about the monitoring of signals by using the aortic blood vessels to take out organic signals from arterial waves. The sensor is fixed near to the heart valve that detects the blocks or any other problem arises in the human body. the other method is known as catheter which is inserted into our human body to find any sort of health disorders in sequential time difference. In ^[3], Sleep observance is used to observe the sleep timings in a whole day of human's life span. In this paper, respiratory and cardiac problems can be noted. Especially, during the night time there is a emergency purpose, the watch monitor is found to measure the patients health. This is also known as sleep monitoring using the wearable watch type. In ^[4], In this paper, they have used a pressure mask with ECG device for the better application. The signal can be measured using the oximeter which is used to find the amount of oxygen flow in the blood. The viscous observation is the fluid resistance flow in the blood. The viscous observation is the fluid resistance flow in the blood. The pressure therapy helps to cures any

Heart Rate Monitoring System using Pulse Sensor with Data Stored on Server

type of disorder in the human body.

There are two types of pressure of airways which is negative and positive. In ^[5], In this project, smart chair monitoring is used with the advanced features used here is telemonitoring with additional system is implemented. This can be urged to use because of the emergency health problems. The patients can be monitored by keeping them in smart chair very comfortably for the aged people. This can also be connected by using GSM, bluetooth, wi-fi and other network connections.

III. HEART RATE MONITORING SYSTEM

Figure 1: Block diagram of Heart rate monitoring system

1. SIGNIFICANCE OF HEART

The heart is the most essential organ among the whole parts of the human body. Thus, without heart no humans can survive. Nowadays, heart transplantation is more common in today's world. It can be easily transplanted. The heart acts as a supplier, which pumps blood to all parts of the body, Not only in humans but also in each and every species on the planet earth. The heart supplies oxygen to our body and takes out carbon dioxide and other wastes substances. It also contains the three major vessels like arteries, veins and capillaries with the blood cells like red blood cells, white blood cells and platelets.

2. PULSE SENSOR

Figure 2: Pulse Sensor

Pulse Sensor is a simple sensor which is used in many places. The basic sensor has three pins namely, ground, Vcc and the input signal (which is also known as A0 signal). The term pulse sensor represents that in order to find the heart

beat rate. Thus, the sensor is in heart shape in its nature. The pin is constructed in such a way to indicate the heart rate. It can be used either in the breadboard or in the printed circuit board (PCB). When it is connected with the Arduino or with the ESP8266 Wi-Fi module, the LED is in ON condition. It works either in 3v or 5v with the help of internet connection

3. APACHE WEB SERVER

Apache net Server is a one of the types of open source web server. It is known as apache HTTP server of all the websites. It offers power of about 46% around the websites of the web browser. It can work in any website condition but there should be the perfect power availability. In apache, any type of programming languages can be programmed. The web servers differ from one system to another hosted. It can be easily hosted with additional type of HTTP servers.

4. XAMPP Platform

XAMPP software is a free and open source network. It works on different operating softwares like windows, MAC and Linux system. Whenever the xampp platform is installed in windows system, thus it acts as a local host or a local network. Generally, there were two local hosts like WAMPP and XAMPP. But wampp works only on windows, Xampp works in all types of operating systems. Among the web applications in PHP, Xampp server is best for the open source network.

5. ESP8266 WI-FI Module

ESP8266 is a wi-fi module which is used mainly for the arduino applications. Esp8266 module can be interfaced with arduino as well as in microcontrollers. It can be made either through hole or the SMD components. It consumes less power when compared to other devices.

Figure 3: Esp8266 sensor

1. It works as general purpose input and output in many ways.
2. It uses the communication interfaces like SPI, I²C and wifi modules etc
3. It also relates with PWM, PCM and UART communication.

IV. PROPOSED FRAME WORK

Figure 4: Pinout of Esp8266

Pulse sensor is connected with ESP8266 WIFI module, the Vcc of pulse sensor is connected to 3.3 v of WIFI module, ground pin is connected to ground of WIFI module, the signal pin is connected to analog pin of WIFI module. ESP8266 pins are connected to the suitable pulse sensor pin out. After giving the connections, the program is uploaded to the ESP8266 using to UART communication. The program is written by using Arduino IDE software. Here, the ESP8266 acts as a station point, where it is connected to specific WIFI network with internet enable. The data from the ESP is stored into the local database, the database is created using XAMPP platform. Here, the API(Application program interface) acts as a interface between hardware and software. API is written on PHP using sublime text. These, pulse sensor and esp8266 WIFI module are connected in breadboard. Pulse sensor finds the heart rate of the person within a fraction of second. The heart rate can be detected by using any finger of human. The heart rate can be seen by LIVE ie., the XAMPP platform detects the accurate value of heart beat which is ranges from 70 to 80 beats per minute, and with actual time and date.

V. EXISTING SYSTEM

Nowadays, heart rate monitoring is maintained in hospitals and used in many public as well as private places etc. This is a compact device and can be taken anywhere easily. The heart rate device can be connected with other devices like microcontroller, MATLAB software and other suitable hardware and software can be used.

VI. ADVANTAGES

When we take the advantages of heart rate monitoring it is used in almost all the hospitals as well as for the use of normal human beings. It is low of cost when compared to other sensor types. It is a compact device which we can take it to anywhere else. For the emergency use , this module is very common among others. It is easy to use and any people can handle it. By using the finger, we can able to find the heart rate easily.

VII. PROCESSING SOFTWARE

```
#include <ESP8266WiFi.h>
#include <ESP8266WebServer.h>
const char *ssid = "vivo"; // change according to your Network - cannot be longer than 32 characters!
const char *pass = "vivo123456789"; // change according to your Network
const char *host = "192.168.43.185";
bool BeatComplete=false;
int LastTime=0;
int BPM=0;
bool BPMCalcing=false;

#define UpperThreshold 550
#define LowerThreshold 500

// Update these with values suitable for your network.
IPAddress ip(192,168,43,49); //Node static IP
IPAddress gateway(192,168,43,1);
IPAddress subnet(255,255,255,0);
int D;
String data;
ESP8266WebServer server(80);

void setup() {
  Serial.begin(9600);
  pinMode(A0,INPUT);
  //ESP8266.begin(9600);
  WiFi.begin(ssid, pass);
  WiFi.config(ip, gateway, subnet);
  // WiFi.config(ip);

  while (!WiFi.status() != WL_CONNECTED){}
```

Figure 5: Arduino code

Arduino code is programmed by using the Arduino UNO software. The program lines from 30 to 40 based on the type of functioning used. Like c program, arduino has the header files or preprocessor files is used in it. Arduino UNO is used in both software side as well as hardware side. The pin out ranges from 1 to nearly 25 which differs from one board to another. It consists of pins namely, analog inputs, outputs, USB connection and other interfaces. The inputs can be send sequentially one by one. Thus, it uses both serial and parallel communication interfaces. The outputs can be viewed through output window and it can be located in either side of the program window. It can be either analog and digital inputs. It also uses I²c, SPI and USB interfaces etc. The outputs can be indicated with LEDs, sensors or connected with breadboards.

VIII. EXPERIMENTATION AND RESULT OBTAINED

Figure 6: Connection

The above picture represents the connection between the esp8266 module and pulse sensor. The connections can also be done with printed circuit board and also with simple boards. The output end of the ESP is wired with the arduino program in pc.

Figure 7: Output of data storage

Heart Rate Monitoring System using Pulse Sensor with Data Stored on Server

The diagram shows the heart rate data value in local host for the later on use.

OUTPUT OF HEART BEAT

Figure 8: output of Heart value

The above diagram the pulse rate of patient based on the health conditions,, this can be seen sequentially one by one.

IX. FUTURE WORK

Using this concept, the future work is we can remotely control/move the things around the physically abled persons. Whenever there is a rise in the heart rate, we can connect this module to the emergency alert to the nearby hospital ambulance. This can be later upgraded to other module like microcontroller, vlsi and advanced types of integrated boards.

X. CONCLUSION

Thus, we have shown the results of both hardware and simulation part of "Heart beat rate monitoring system using pulse sensor with data stored on server". We have discussed about the monitoring of heart rate which can be calculated within a fraction of seconds. ARDUINO software for programming purpose and output will be shown in hardware part. This hardware is easy to handle and quite simple in its connections.

XI. ACKNOWLEDGEMENT

The author would like to thank Ms.Dr.R.Puviarasi department of ECE for their support and guidance through the development of this project and for their advice in making it possible.
